

# Lambda b Polarization & Angles

Asher Sabbagh & Mero Elmarassy

# Lambda b

$\Lambda_b^0$

- Particles similar to proton in structure with one u quark replaced with a beauty (b) quark (udb)
- B quarks come from Z decay
- Decays via weak force to lambda 0 (uds) and dilepton:

$$\Lambda_b^0 \rightarrow \Lambda^0 + \mu^+ \mu^-$$

$$\Lambda^0 \rightarrow p^+ + \pi^-$$

Lambda 0 particle

- Since this is a weak force interaction, the spin of the lambda b matters
- Helicity = component of spin in direction of momentum
- Polarization of Lb comes from polarization of Z boson

*Right-handed:*

*Left-handed:*

$H = 0$   
(longitudinal)

$H = 1$   
(transverse)

$\theta$ : angle between  $\vec{p}$  and z-axis  
 $\phi$ : polar angle

$$\hat{n} = \hat{n}_\perp = \hat{p}_{\Lambda_b^0}^{\text{lab}} \times \hat{p}_{\text{beam}}^{\text{lab}}$$

$$\hat{n}_\parallel = \hat{p}_{\Lambda_b^0}^{\text{lab}}$$

# Calculating Angles

- Angles were calculated by boosting into the Lambda b frame, then finding the vector angle between the momenta in this frame
- All angles were calculated for two ROOT files: one with pure physics, and one with simulated detector effects

# Detector effects

Need to fit the angles to a pdf: (Mero)

$$\frac{d^6\Gamma}{dq^2 d\vec{\Omega}} = \frac{3}{32\pi^2} \left( \sum_{i=0}^{34} K_i(q^2) f_i(\vec{\Omega}) \right)$$

$$\frac{d^6\Gamma}{dq^2 d\vec{\Omega}} = \frac{3}{32\pi^2} \left( (K_1 \sin^2 \theta_l + K_2 \cos^2 \theta_l + K_3 \cos \theta_l) + \right.$$

$$(K_4 \sin^2 \theta_l + K_5 \cos^2 \theta_l + K_6 \cos \theta_l) \cos \theta_b +$$

$$(K_7 \sin \theta_l \cos \theta_l + K_8 \sin \theta_l) \sin \theta_b \cos (\phi_b + \phi_l) +$$

$$(K_9 \sin \theta_l \cos \theta_l + K_{10} \sin \theta_l) \sin \theta_b \sin (\phi_b + \phi_l) +$$

$$(K_{11} \sin^2 \theta_l + K_{12} \cos^2 \theta_l + K_{13} \cos \theta_l) \cos \theta +$$

$$(K_{14} \sin^2 \theta_l + K_{15} \cos^2 \theta_l + K_{16} \cos \theta_l) \cos \theta_b \cos \theta +$$

$$(K_{17} \sin \theta_l \cos \theta_l + K_{18} \sin \theta_l) \sin \theta_b \cos (\phi_b + \phi_l) \cos \theta +$$

$$(K_{19} \sin \theta_l \cos \theta_l + K_{20} \sin \theta_l) \sin \theta_b \sin (\phi_b + \phi_l) \cos \theta +$$

$$(K_{21} \cos \theta_l \sin \theta_l + K_{22} \sin \theta_l) \sin \phi_l \sin \theta +$$

$$(K_{23} \cos \theta_l \sin \theta_l + K_{24} \sin \theta_l) \cos \phi_l \sin \theta +$$

$$(K_{25} \cos \theta_l \sin \theta_l + K_{26} \sin \theta_l) \sin \phi_l \cos \theta_b \sin \theta +$$

$$(K_{27} \cos \theta_l \sin \theta_l + K_{28} \sin \theta_l) \cos \phi_l \cos \theta_b \sin \theta +$$

$$(K_{29} \cos^2 \theta_l + K_{30} \sin^2 \theta_l) \sin \theta_b \sin \phi_b \sin \theta +$$

$$(K_{31} \cos^2 \theta_l + K_{32} \sin^2 \theta_l) \sin \theta_b \cos \phi_b \sin \theta +$$

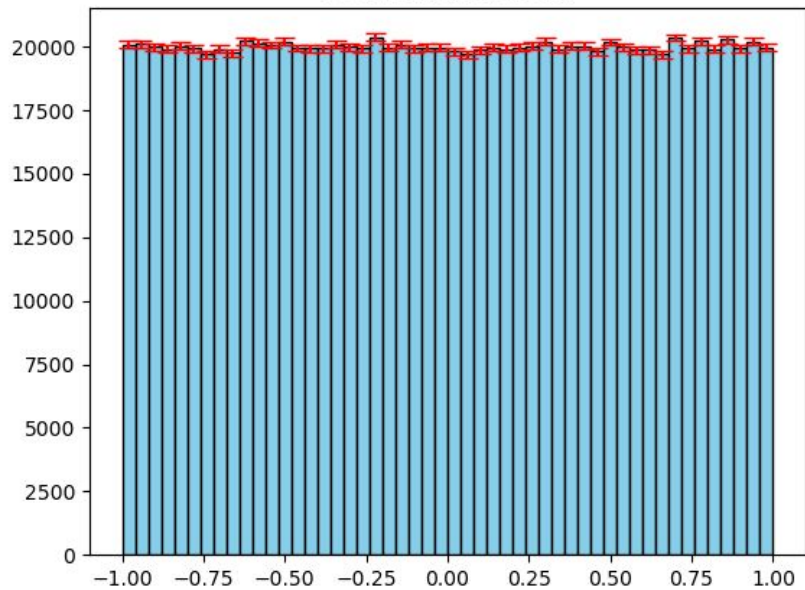

$$(K_{33} \sin^2 \theta_l) \sin \theta_b \cos (2\phi_l + \phi_b) \sin \theta +$$

$$(K_{34} \sin^2 \theta_l) \sin \theta_b \sin (2\phi_l + \phi_b) \sin \theta \left. \right) .$$

Can use efficiencies to simply calculation:

$$\text{efficiency}_i = \frac{n_{i_{\text{det}}}}{n_{i_{\text{nodet}}}}$$

costhetab nodetector

costhetab detector

costhetat nodetector

costhetat detector

costhetamu nodetector

costhetamu detector

- Asymmetry possibly due to how muons are selected from background in FCC simulator - still needs work

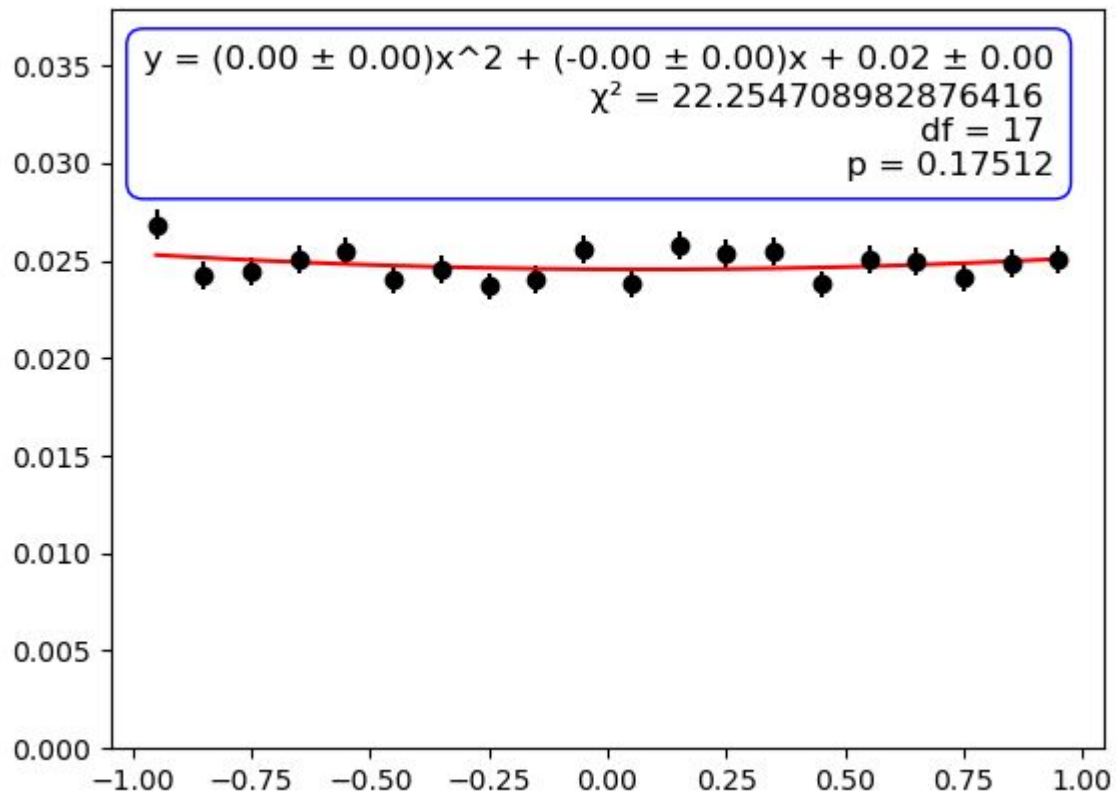

costhetap nodetector

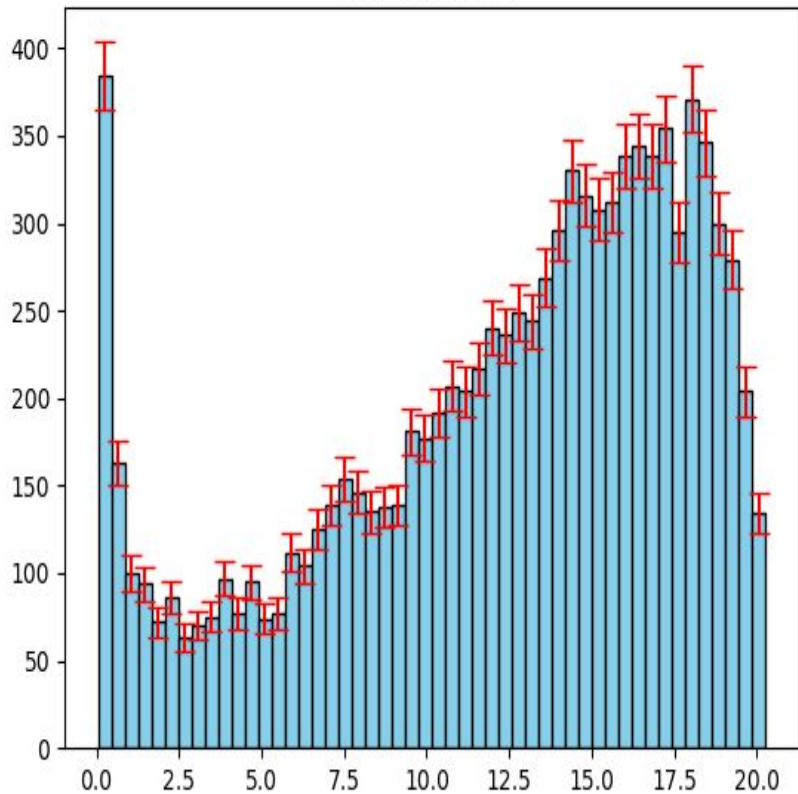

costhetap detector

q2 nodetector

q2 detector

Shape comes from different Feynman diagrams at different  $q^2$

# q2 Binning:

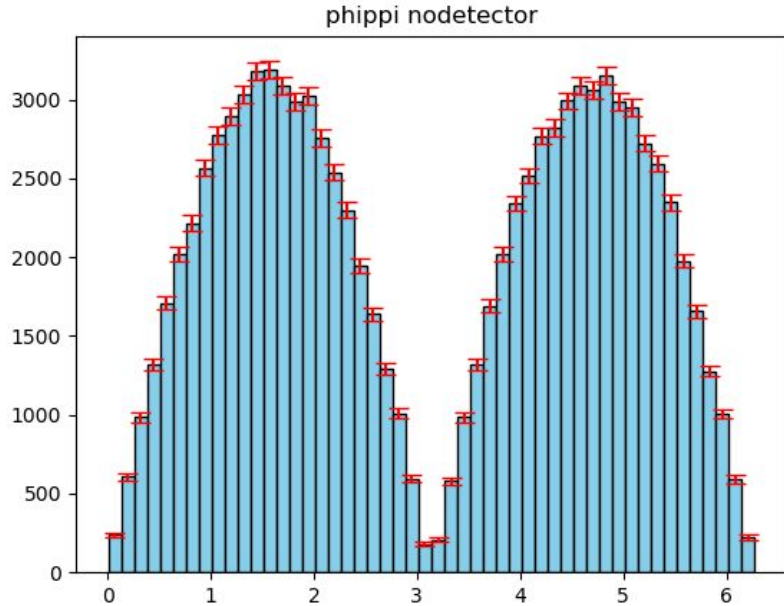

# Issue with phi angles:

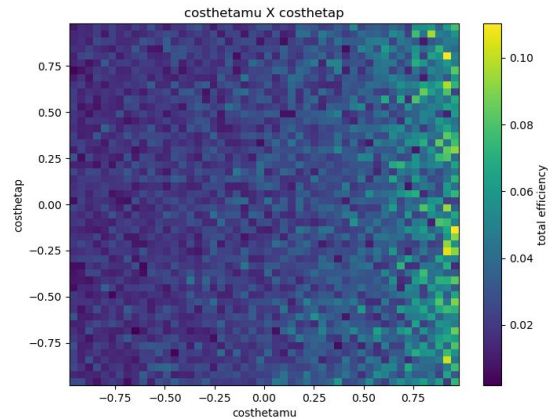

# Ran phi angles over phase space simulation:

Using C++ script:

# 2D efficiencies:

# Mero's Work: Fitting angles

$\cos(\text{thetamu})$  (ignoring  
efficiencies)

phi

- Fit parameters are related to the Lambda b polarization
- Check validity of PDF by taking pulls for each parameter:

$$\text{pull} = \frac{\mu_{\text{total}} - \mu_{\text{sample}}}{\sigma_{\text{sample}}}$$

- Expect gaussian pulls with mean=0, sigma=1

# Biased pulls in some parameters:

Good pull example

Bad pull example (maybe not randomizing initial parameter)

# Whats next:

- Biased pulls could be a result of how the ROOT files are generated
- Right now the code is using particle ID, but this is unrealistic
- Instead, use geometry of the decay:
