∃ →

- We wish to use the lattice to study field theories at or near conformal fixed points
- On a periodic square lattice, wraparound effects are always relevant
- Weyl transform from flat Euclidean manifold to a "cylinder"

$$\mathbb{R}^d o S^{d-1} imes \mathbb{R}$$

$$ds^2_{\mathsf{flat}} = r^2[(d\log r)^2 + d\Omega^2_{d-1}]
ightarrow ds^2_{\mathsf{cyl.}} = dt^2 + d\Omega^2_{d-1}$$

- Angular directions are periodic by definition
- Radial coordinate defined as $t = \log r$
- Power-law correlation functions decay exponentially in t
- Lattice volume grows exponentially with number of time-slices

- In d > 2, angular portion of manifold cannot be discretized uniformly
- In 3 dimensions, $\mathbb{R}^3\to S^2\times\mathbb{R}$ can be discretized by tessellating an icosahedron [2]

- Produces a non-uniform simplicial complex
- Higher dimensions can be discretized in a similar manner

• Test case is scalar field theory on S^2 with discretized action

$$S = \frac{1}{2} \sum_{\langle xy \rangle} \frac{V_{xy}}{\ell_{xy}^2} (\phi_x - \phi_y)^2 + \sum_x \sqrt{g_x} \left(\frac{1}{2} m^2 \phi_x^2 + \lambda \phi_x^4 \right)$$

- Free scalar theory ($\lambda = 0$) on a simplicial complex can be solved exactly with the finite element method (FEM)
- \bullet Geometric factors $V_{xy},\,\ell_{xy},\,\sqrt{g_x}$ are determined by lattice geometry

QFE Counter Terms

- Interacting theory (λ ≠ 0) has UV divergences due to quantum fluctuations from loops
- The quantum theory does not become spherical as a → 0 so conformal symmetry is lost
- At small λ, a perturbative mass counterterm renormalizes the theory [3]

$$S \rightarrow S + \frac{1}{2} \sum_{x} \sqrt{g_x} \delta m_x^2 \phi_x^2$$

 Renormalized coupling must remain fixed in the continuum limit, therefore λ → 0 as a → 0

9/25

- Can be used to accurately determine CFT parameters Δ_{σ} , $\Delta_{\sigma'}$, Δ_{ϵ} , $\Delta_{\epsilon'}$, etc. [4]
- Scaling exponents for σ' and ϵ' operators are required as inputs for the conformal bootstrap program [7]
- $\bullet\,$ Simulations and data analysis are ongoing for critical ϕ^4 theory in 3 dimensions
- We are also planning to pursue finite element formulations with gauge theories and fermions, preliminary work has been done [5]

QFE Counter Terms

 To first order, one-loop perturbative counter term for φ⁴ theory on S² has the form

$$\delta m_x^2 = 6Q\lambda \log(\sqrt{g_x}) \qquad Q = \frac{\sqrt{3}}{8\pi}$$

 Conjecture that conformal symmetry can be restored at strong coupling by adjusting strength of counterterms as a function of λ.

$$\delta m_x^2 \to C(\lambda) \delta m_x^2$$

• We obtain good results [1] with $C(\lambda) = e^{-Q\lambda}$. Counterterms become

$$\delta m_x^2(\lambda) = 6Q\lambda e^{-Q\lambda} \log\left(\sqrt{g_x}\right)$$

Evan Owen (BU)

- Stability of critical surface near the strong coupling Wilson-Fisher fixed point is improved by tuning the strength of the perturbative counterterms.
- Further tuning is required to fully restore symmetry in the continuum limit.
- Exact form of non-perturbative counterterms is not well understood, but may provide direct access to the Wilson-Fisher fixed point.

æ

- Approaching the continuum limit, tangent planes of the discretized sphere S^2 become locally uniform, with smoothly varying triangles
- Point defects at 12 "exceptional" points

- Critical Ising model can be solved exactly in 2d via free massless fermion [8]
- Wolff [9] relates Ising model to free Majorana fermion on an equilateral triangular lattice with periodic boundaries via a loop expansion
- We generalize this to a uniform lattice of arbitrary triangles to relate Ising couplings (K₁, K₂, K₃) to lattice geometry (l₁, l₂, l₃)

$$S = -\sum_{\langle xy
angle} \mathcal{K}_i \sigma_x \sigma_{x+i} \quad \sinh(2\mathcal{K}_i) = rac{\ell_i^*}{\ell_i}$$

 This allows us to simulate the 2d Ising model on a torus with an arbitrary modular parameter τ (related to ℓ_i's)

QFE Counter Terms (USQCD AHM 2022)

• Continuum spin-spin correlation function is known analytically for arbitrary τ [6], shown for $\ell_i \propto \{4:5:6\}$

э

• Our simulation result, with horizontal axis is in lattice steps

• Horizontal axis scaled according to lattice geometry

• Conventional finite-size scaling analysis on {4 : 5 : 6} lattice

- We expect that applying critical couplings will give the critical Ising model on S^2 , preliminary results support this
- Can also be applied to other 2-dimensional manifolds embedded in \mathbb{R}^3

- Lattice radial quantization is effective for studying field theories near conformal fixed points
- We are working on several approaches for studying strongly-coupled field theories on curved manifolds using finite element methods
- We have developed a framework for performing simulations of the 2d critical Ising model on a torus with arbitrary modular parameter with potential application to simulations on arbitrary curved manifolds
