# Questions for the next decade

- How does the strongly interacting medium emerge from an asymptotic free theory?
- Can we see quasi particles (quarks and gluons) in the Quark-Gluon Plasma? What is the structure of QGP probed at different length scales?
- What are the transport properties of the medium?

**How does QGP work?**

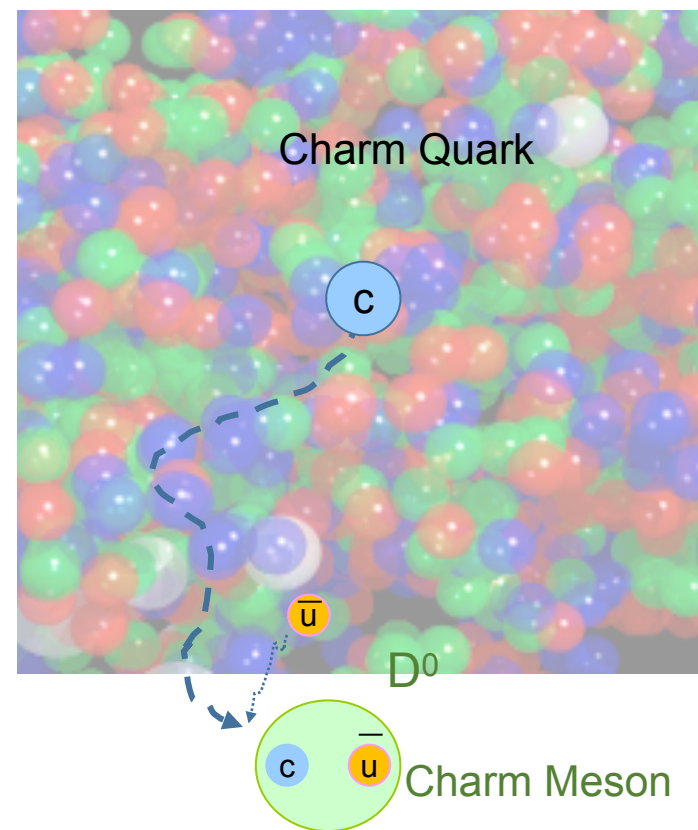

# New tools: Fast quarks scattered by QGP

Indication of **medium recoil and QGP wake**

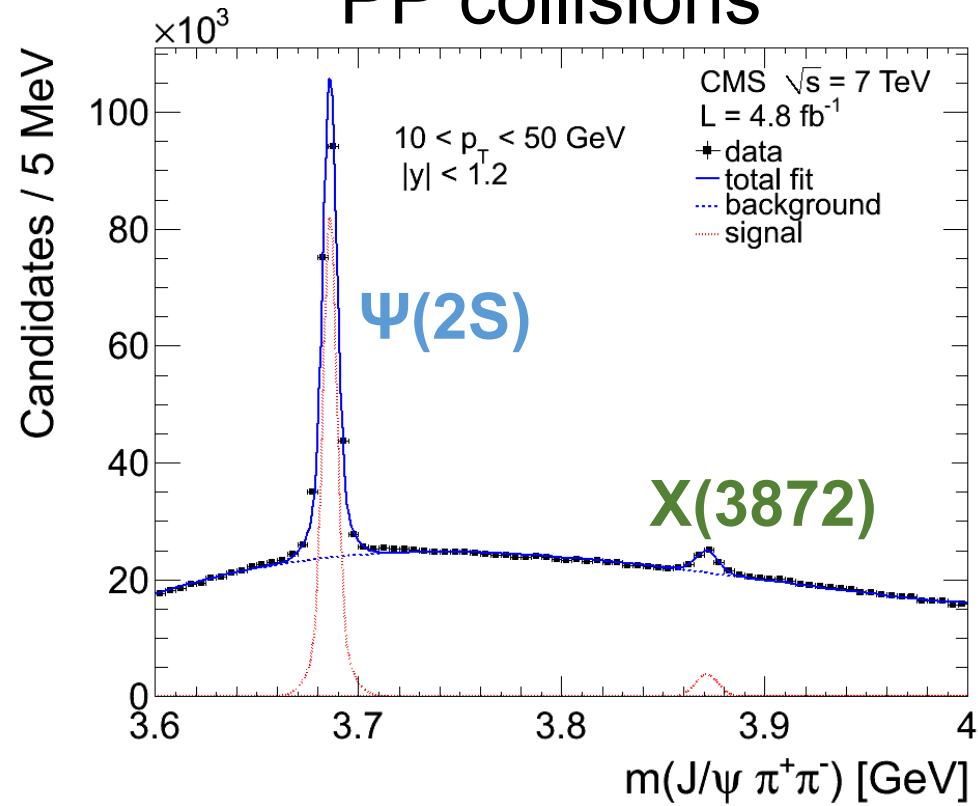

# New tools: Heavy quarks as probe particles in QGP

- **Charm** and **beauty** quarks (heavy quarks) are produced before **QGP** formation ( $<0.2$  fm/c)
- Low momentum heavy quarks are then “kicked around” by quasi-particles (**Brownian Motion**)  
→ **A direct window on the in-medium QCD force!**

# New tools: QCD Exotica as probes of hadronization

## PP collisions

$D^0 - \bar{D}^{*0}$  molecule

Charmonium Tetraquark (4q)

$\Gamma_{4q} \approx \Gamma_{c\bar{c}}$   
 $\approx 0.3 \text{ fm}$

$\Gamma_{\text{molecule}}$   
as large as 5 fm

## PbPb collisions

2018 data: First evidence of inclusive  $X(3872)$  production in heavy ion collisions!

(statistical significance  $\sim 4\sigma$ )

PRL 128, 032001 (2022)

Observation of  $X(3872)$  is expected ( $>5\sigma$ ) in Run3

Run3+4: Enables more differential studies (vs.  $p_T$  and centrality)

# New tools: JETSCAPE Theory framework

## The JETSCAPE Collaboration

The Jet Energy-loss Tomography with a Statistically and Computationally Advanced Program Envelope (JETSCAPE) collaboration is an NSF funded multi-institutional effort to design the next generation of event generators to simulate the physics of ultra-relativistic heavy-ion collisions.

## Mission

The JETSCAPE Collaboration: an interdisciplinary team of physicists, computer scientists, and statisticians, from thirteen institutions, develops a comprehensive software framework that will provide a systematic, rigorous approach to simulating the complex dynamical environment of relativistic heavy-ion collisions. To read more [click here!](#)

**MITHIG is part of the JETSCAPE collaboration  
developing a theory framework for nuclear collisions**

# New tools: AI/ML

## Department of Energy Announces \$5.7 Million for Research on Artificial Intelligence and Machine Learning (AI/ML) for Nuclear Physics Accelerators and Detectors

Projects will advance understanding of atomic structure and the nature of matter and antimatter

December 3, 2021

Schematic for the sPHENIX detector at the Relativistic Heavy Ion Collider (left) and a preliminary concept for a future Electron-Ion Collider detector (right).

WASHINGTON, D.C. - Today, the U.S. Department of Energy (DOE) announced \$5.7 million for six projects that will implement artificial intelligence methods to accelerate scientific discovery in nuclear physics research. The projects aim to optimize the overall performance of complex accelerator and detector systems for nuclear physics using advanced computational methods.

"Artificial intelligence has the potential to shorten the timeline for experimental discovery in nuclear physics," said Timothy Hallman, DOE Associate Director of Science for Nuclear Physics. "Particle accelerator facilities and nuclear physics instrumentation face a variety of technical challenges in simulations, control, data acquisition, and analysis that artificial intelligence holds promise to address."

## MITHIG + other MIT groups part of collaboration developing real-time AI applications for sPHENIX and EIC

# New tools: sPHENIX at RHIC

# New tools: MVTX HF tracker in sPHENIX

Built by team including  
LANL, LBNL, MIT, MIT-Bates

Enables sPHENIX heavy-  
flavor program

Camelia  
(now in Paris)

Cameron  
(HF convener)

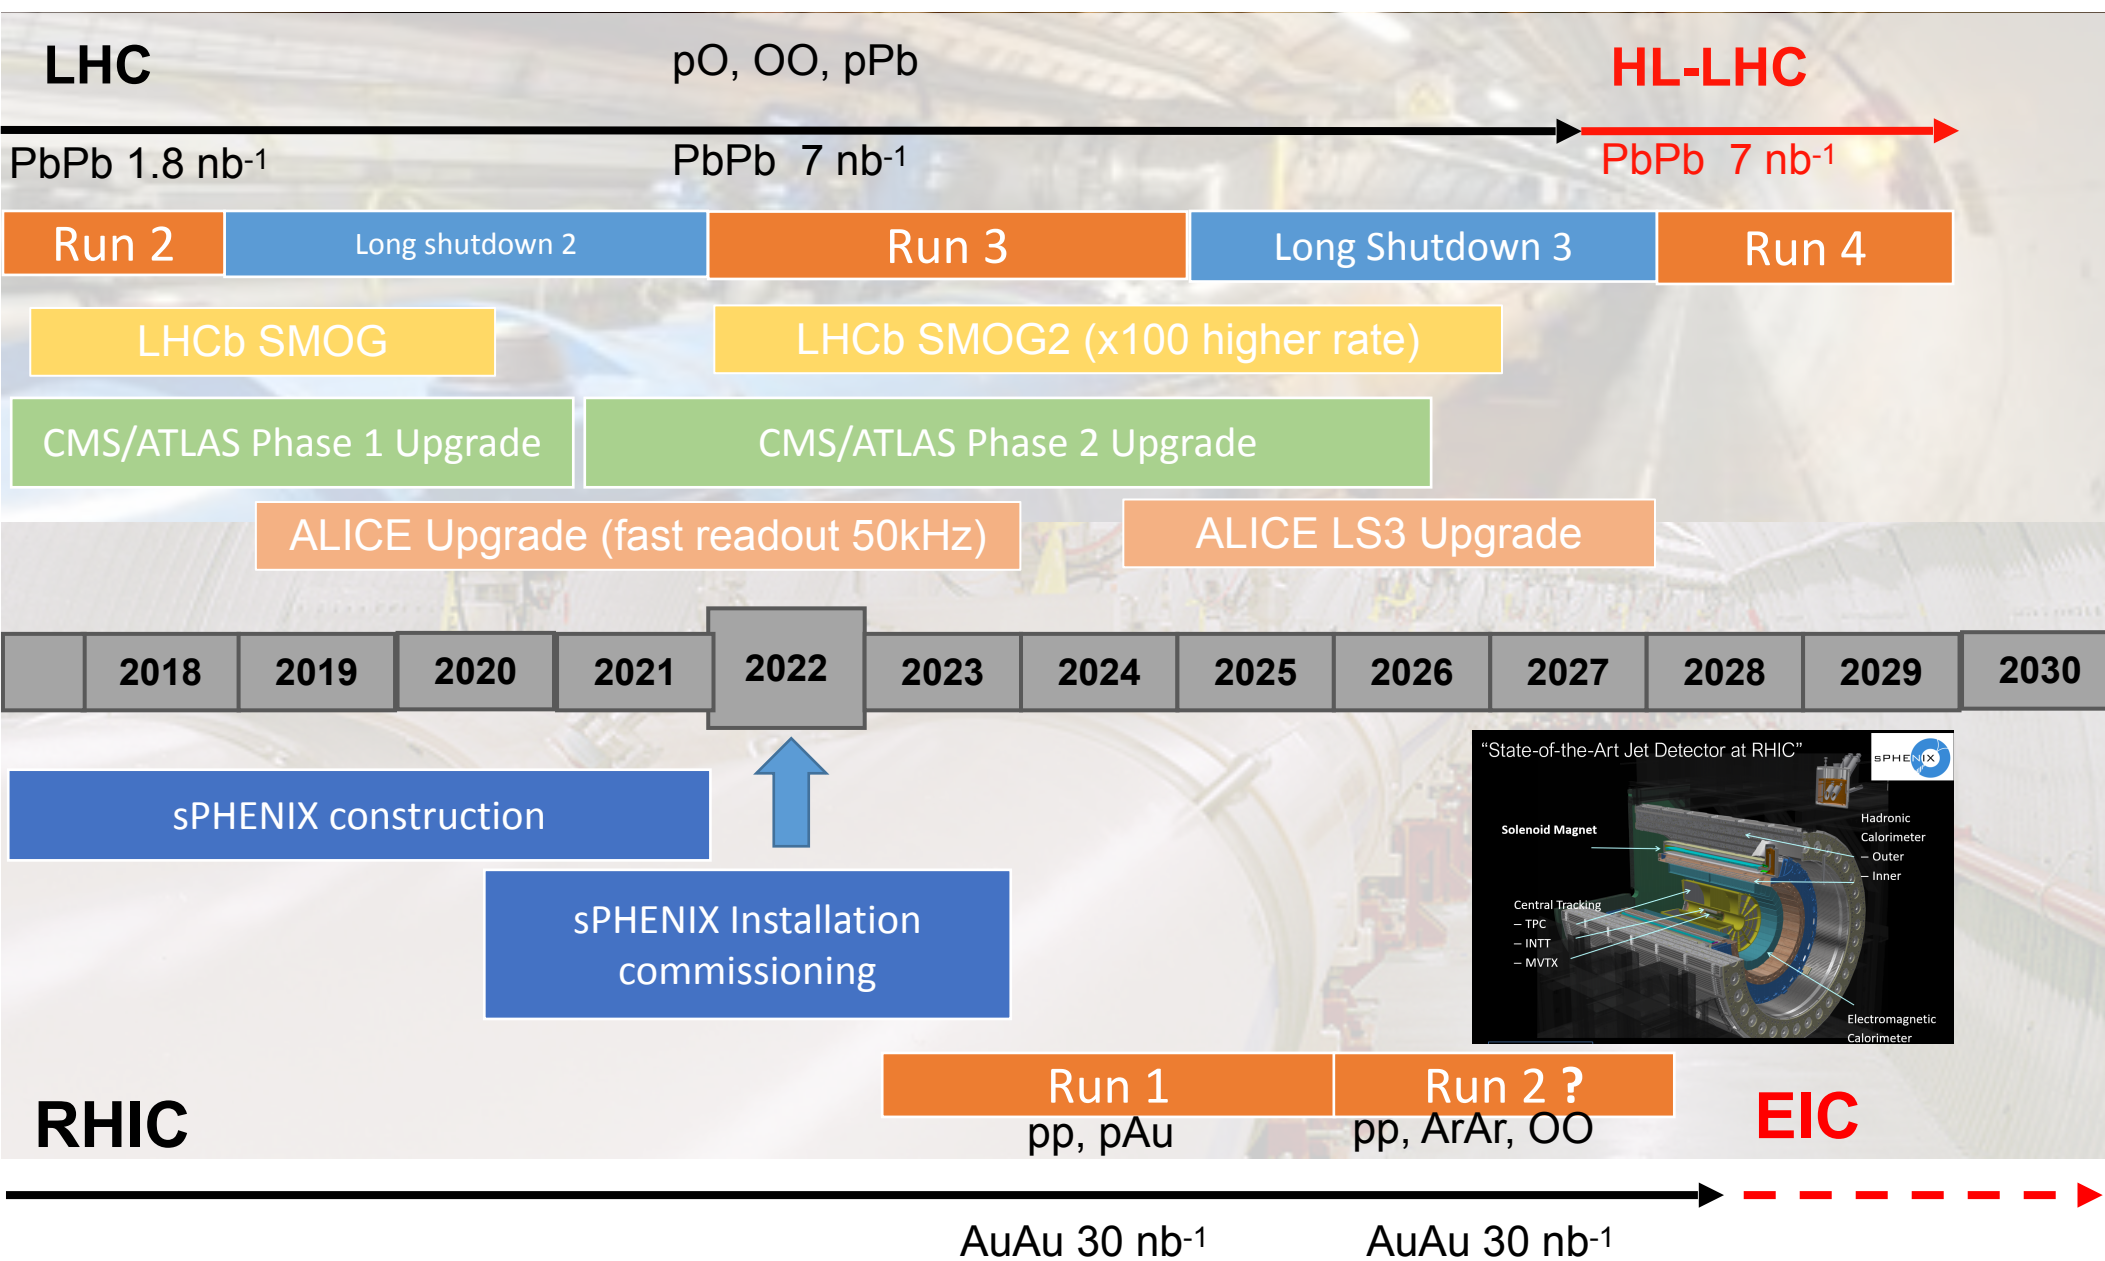

Yasser  
(just joined)

# Old tool with new tricks: CMS + phase1/2 upgrades

# LHC, RHIC and EIC Timeline

# Physics Goal for the Next Few Years

- **Thermalization and Hadronization of Heavy Quarks**
  - Modification of Heavy quark hadronization with fully reconstructed  $D_0$ ,  $D_s$ ,  $D^*$ ,  $B^+$ ,  $B^0$ ,  $B_s$ ,  $\Lambda_c$ ,  $\Lambda_b$
  - Extension to doubly charmed baryons
  - Direct detection of charm diffusion: jet- $D^0$  and  $\gamma$ - $D^0$  angular correlation
  - $D\bar{D}$  correlations: studies of heavy quark energy loss mechanism
- **Extraction of Medium Properties at Various Length Scales**
  - Photon- and Z-tagged jets and hadrons
  - Jet substructure as a tool for the study of QGP constituents (“Moliere scattering”)
- **Quark Gluon Plasma Formation in Small Systems**
  - Flow correlation in high statistics peripheral PbPb collisions
  - Search for jet quenching in high multiplicity pp, pPb, pO and OO collisions
  - Search for QGP signal in  $e^+e^-$
- **Studies of the Internal Structure of Exotic Particles**
  - Probe the inner structure of  $X(3872)$  with QGP
  - Search for other exotic particle such as  $T_{cc}$

# Life in MITHIG as a PhD Student

- **2022:** Join the group. Get started with CMS Run II data and sPHENIX simulation.
- Get involved in the sPHENIX construction, detector commissioning. Get involved in the CMS data-taking strategy preparation.
- **2022 Nov/Dec:** High Luminosity CMS data-taking at CERN
- **2023:** The first sPHENIX data-taking at BNL
- **2023-27** Physics analysis with high statistics CMS data and/or sPHENIX data, prepare for graduation.
- **2027-28** Most likely, become a postdoc and stay in academia
