# Theta Induced Nucleon EDM from Overlap Fermions

Jian Liang (South China Normal University)

**XQCD** Collaboration

04/21/2023 @ USQCD All-hands meeting

## **Nucleon EDM and CP-Violation**

nEDM upper limit 90%CL (ecm)

Nucleon EDM (NEDM) is a sensitive probe of CP violation (CPV).

The contribution to the NEDM from the weak CP-violating phase is 5 orders of magnitude smaller than the current experimental limit.

**Strong CPV and/or BSM physics?** 

# **Nucleon EDM from Lattice QCD**

Y. Aoki et al. PRD83:074508 (2011)

The anomalous Ward identity holds for overlap fermions, and it guarantees that  $d_n \rightarrow 0$  when  $m_q \rightarrow 0$  even at finite lattice spacings.

### **Systematic Uncertainties**

The total systematic uncertainty is found to be 22%, which comes from the two-state fits (18%), the momentum extrapolation (4%), the CDER technique (12%) and the chiral extrapolation (3%).

#### **Chiral Extrapolation and Results**

$$d_n^{(PQ)} = \frac{e \ \overline{\theta} \ m_{\text{sea}}}{4\pi^2 f^2} \left[ F_\pi \ \log\left(\frac{m_\pi^2}{\mu^2}\right) + F_J \ \log\left(\frac{m_J^2}{\mu^2}\right) \right] \\ + \overline{\theta} \ \frac{e}{\Lambda_\chi^2} \left[ \frac{m_{\text{sea}}}{2} \ c(\mu) \ + \ d\left(m_{\text{sea}} - m_{\text{val}}\right) + fq_{jl} \ (m_{\text{sea}} - m_{\text{val}}) \right] \right]$$

### **Summary and Outlook**

# Using overlap fermions, we are having very clear signal for nucleon EDM.

Study with lighter pion mas on going.

#### Study with lighter pion masses and more lattice spacings is

Thank you
